CSCE 411: Design and Analysis of Algorithms

Lecture 2: Divide and Conquer, Part II

Date: Nate Veldt, updated by Samson Zhou

Course Logistics

- Read section 4.6 if you are interested in the proof of the Master Theorem.
- Continue skimming chapters 1-3
- Begin reading Chapter 15 for our next unit on Dynamic Programming
- Syllabus quiz is due Sat, Jan 18. HW 1 and intro video due Fri, Jan 24

1 Continued Analysis of Merge Sort

Merge Sort. Given n numbers to sort

- Divide the sequence of length n into arrays of length $\lceil n/2 \rceil$ and $\lceil n/2 \rceil$
- Recursively sort the two halves
- (Merge Procedure) Combine the two halves by sorting them.

Question 1. What is the runtime of the merge procedure in Merge Sort?

- $\Theta(1)$
- $\Theta(n \lg n)$
- $\mathbf{C} \Theta(n)$
- $\Theta(n^2)$

2 Recurrence Analysis for Divide and Conquer

Runtimes for divide and conquer algorithms can be described in terms of a
relation, which
Let $T(n)$ denote the runtime for a problem of size n .
Example: merge-sort Assume for this analysis that $n = 2^p$ where $p \in \mathbb{N}$.

3 Three methods for solving recurrences

Given a recurrence relation, there are three approaches to finding the overall runtime.

- Recursion tree:
- Substitution method:
- Master theorem:

4 The Master Theorem for Recurrence Relations

Theorem 4.1. Let $a \ge 1$ and b > 1 be constants, let f(n) be a function, and let T(n) be defined on the nonnegative integers by the relation:

1. If $f(n) = O(n^{\log_b a - \epsilon})$ for some constant $\epsilon > 0$, then ______

2. If $f(n) = \Theta(n^{\log_b a})$, then

3. If $f(n) = \Omega(n^{\log_b a + \epsilon})$ for some constant $\epsilon > 0$, and if $af(n/b) \le cf(n)$ for some constant c < 1 and all sufficiently large n, then

4.1 Example: Merge-Sort

Recall that Merge-Sort satisfies the following recurrence:

$$T(n) = \begin{cases} \theta(1) & \text{if } n = 1\\ 2T(n/2) + \theta(n) & \text{if } n > 1 \end{cases}$$
 (1)

We can apply the master theorem with:

4.2 What to know about the master method?

Proof idea:

A full proof can be found in Section 4.6 of the textbook.

What's more important:

4.3 Examples

Apply the master theorem to the following recurrences:

$$T(n) = 9T(n/3) + n \tag{2}$$

$$T(n) = 3T(n/4) + n\log n \tag{3}$$

$$T(n) = 7T(n/2) + \Theta(n^2) \tag{4}$$

5 Strassen's Algorithm for Matrix Multiplication

Let A and B be $n \times n$ matrices, and C = AB. The (i, j) entry of C is defined by

$$c_{ij} = \sum_{k=1}^{n} a_{ik} b_{kj}$$

Algorithm 1 Simple Square Matrix Multiply

```
Input: A, B \in \mathbb{R}^{n \times n}

Output: C = AB \in \mathbb{R}^{n \times n}

Let C = zeros(n, n)

for i = 1 to n do

for j = 1 to n do

c_{ij} = 0

for i = 1 to n do

c_{ij} = c_{ij} + a_{ik}b_{kj}

end for

end for

Return C
```

5.1 An attempt at divide-and conquer

Assume that $n = 2^p$ for some positive integer p > 1.

Algorithm 2 Simple Recursive Square Matrix Multiply (SSMM)

```
Input: A, B \in \mathbb{R}^{n \times n}

Output: C = AB \in \mathbb{R}^{n \times n}

if n == 1 then
c_{11} = a_{11}b_{11}
else
C_{11} = SSMM(A_{11}, B_{11}) + SSMM(A_{12}, B_{21})
C_{12} = SSMM(A_{11}, B_{12}) + SSMM(A_{12}, B_{22})
C_{21} = SSMM(A_{21}, B_{11}) + SSMM(A_{22}, B_{21})
C_{22} = SSMM(A_{21}, B_{12}) + SSMM(A_{22}, B_{22})
end if
Return C
```

Question 2. What recursion applies to the above algorithm when n > 1?

A
$$T(n) = 4T(n/2) + O(n^2)$$

B
$$T(n) = 8T(n/4) + O(n^2)$$

$$T(n) = 8T(n/2) + O(n)$$

$$T(n) = 8T(n/2) + O(n^2)$$

5.2 Strassen's Algorithm

Strassen's algorithm introduces a new way to combine matrix multiplications and additions to obtain the matrix C.

Step 1: Partition A and B as before.

Step 2: Compute S matrices

$$S_1 = B_{12} - B_{22}$$
 $S_2 = A_{11} + A_{12}$
 $S_3 = A_{21} + A_{22}$ $S_4 = B_{21} - B_{11}$
 $S_5 = A_{11} + A_{22}$ $S_6 = B_{11} + B_{22}$
 $S_7 = A_{12} - A_{22}$ $S_8 = B_{21} + B_{22}$
 $S_9 = A_{11} - A_{21}$ $S_{10} = B_{11} + B_{12}$

Runtime: we add (or subtract) 2 matrices of size $n/2 \times n/2$, 10 times.

Step 3: Compute P matrices

$$P_{1} = A_{11} \cdot S_{1} = A_{11} \cdot B_{12} - A_{11} \cdot B_{22}$$

$$P_{2} = S_{2}B_{22}$$

$$P_{3} = S_{3}B_{11}$$

$$P_{4} = A_{22}S_{4}$$

$$P_{5} = S_{5}S_{6}$$

$$P_{6} = S_{7}S_{8}$$

$$P_{7} = S_{9}S_{10}$$

Runtime: we recursively call the matrix-matrix multiplication function for 7 matrices of size $n/2 \times n/2$.

Step 4: Combine Using the P matrices, we can show that

$$C_{11} = P_5 + P_4 - P_2 + P_6$$

$$C_{12} = P_1 + P_2$$

$$C_{21} = P_3 + P_4$$

$$C_{22} = P_5 + P_1 - P_3 - P_7$$

5.3 Analysis of Strassen's Method

Question 3. Strassen's algorithm satisfies which recurrence relation for n > 1?

A
$$T(n) = 8T(n/2) + O(n^2)$$

$$T(n) = 23T(n/2)$$

$$T(n) = 7T(n/2) + O(n^2)$$

$$T(n) = 10T(n/2) + O(n^2)$$

$$T(n) = 17T(n/2) + O(1)$$
